

Let's take a better look...

In a conventional approach, information you give the eye doctor is very subjective, based more on what you think you see instead of what you actually see. This latest technology is a complete, accurate description of all abnormalities affecting your eye. Your eye doctor uses your wavefront map as a blueprint for custom-designing your vision correction, whether with refractive surgery such as LASIK, intraocular lenses, contact lenses or glasses.

What does this

The simple answer is, you'll see the best you possibly can! Not only are we able to detect abnormalities, we also can best correct them. This process takes away the guesswork during the exam and also cuts the time in half. In a traditional setting, many patients still have difficulty in certain conditions, such as nighttime, even with corrected vision. Wavefront technology provides the information to the Doctor with immediate results.

What is the cost?

The analysis is only \$30.00 and you are provided with a complete review and understanding of the results from the Optometrist.

I have read and understand the information regarding the 3-D Wave Wavefront Analyzer.

Yes, I do want the 3D Wavefront Testing

No, I do not want the 3D Wavefront Testing
